| FlatHistTMatrixD | | 8 |

2 Data Structure Documentation

2.1 EDep Struct Reference

Energy deposit and GENIE passthrough output tree.

Data Fields

- int **stop**
The detector stop number used, refer to input xml for stop offsets.
- double **vtx** [3]
[GENIE P/T]: The vertex 3-position in cm
- double **vtxInDetX**
[GENIE P/T]: The X position of the vertex relative to the centre of a stop in cm.
- double **XOffset**
[GENIE P/T]: The X offset of stop, stop in cm.
- TObjString * **EventCode**
[GENIE P/T]: The GENIE interaction code.
- double **nu_4mom** [4]
- double **y_True**
[GENIE P/T]: The elasticity of the interaction.
- double **Q2_True**

- [GENIE P/T]: The square 4-momentum transfer of the interaction.*

 - double [FourMomTransfer_True](#) [4]
- [GENIE P/T]: The full 4-momentum transfer of the interaction.*

 - double [W_Rest](#)
- [GENIE P/T]: The reconstructed invariant mass*

 - int [nu_PDG](#)
- [GENIE P/T]: The PDG MC code of the neutrino.*

 - int [PrimaryLepPDG](#)
- [GENIE P/T]: The PDG MC code of the primary lepton*

 - double [PrimaryLep_4mom](#) [4]
- [GENIE P/T]: The 4-momentum of the primary lepton*

 - int [NLep](#)
- [GENIE P/T]: The number of final state leptons in the event.*

 - int [NPi0](#)
- [GENIE P/T]: The number of final state neutral pions in the event.*

 - int [NPiC](#)
- [GENIE P/T]: The number of final state charged pions in the event.*

 - int [NProton](#)
- [GENIE P/T]: The number of final state protons in the event.*

 - int [NNeutron](#)
- [GENIE P/T]: The number of final state neutrons in the event.*

 - int [NGamma](#)
- [GENIE P/T]: The number of final state photons in the event.*

 - int [NOther](#)
- [GENIE P/T]: The number of final state other particles in the event.*

 - double [EKinPi0_True](#)
- [GENIE P/T]: The total kinetic energy of all neutral pions at the end of the GENIE simulation.*

 - double [EMassPi0_True](#)
- [GENIE P/T]: The total mass energy of all neutral pions at the end of the GENIE simulation.*

 - double [EKinPiC_True](#)
- [GENIE P/T]: The total kinetic energy of all charged pions at the end of the GENIE simulation.*

 - double [EMassPiC_True](#)
- [GENIE P/T]: The total mass energy of all charged pions at the end of the GENIE simulation.*

 - double [EKinProton_True](#)
- [GENIE P/T]: The total kinetic energy of all protons at the end of the GENIE simulation.*

 - double [EMassProton_True](#)
- [GENIE P/T]: The total mass energy of all protons at the end of the GENIE simulation.*

 - double [EKinNeutron_True](#)
- [GENIE P/T]: The total kinetic energy of all neutrons at the end of the GENIE simulation.*

 - double [EMassNeutron_True](#)
- [GENIE P/T]: The total mass energy of all neutrons at the end of the GENIE simulation.*

 - double [EGamma_True](#)
- [GENIE P/T]: The total energy of all photons at the end of the GENIE simulation.*

 - double [EOther_True](#)
- [GENIE P/T]: The total energy of all other particles at the end of the GENIE simulation.*

 - double [Total_ENonPrimaryLep_True](#)
- [GENIE P/T]: The total energy of all non-primary leptons at the end of the GENIE simulation.*

 - double [LepDep_FV](#)
- [GEANT4]: The total lepton energy deposited within the stops fiducial volume.*

 - double [LepDep_veto](#)

- [GEANT4]: The total lepton energy deposited within the stops veto volume, but within the active LAr volume of the stop.*

 - double [ProtonDep_FV](#)

[GEANT4]: The total proton energy deposited within the stops fiducial volume.
 - double [ProtonDep_veto](#)

[GEANT4]: The total proton energy deposited within the stops veto volume, but within the active LAr volume of the stop.
 - double [NeutronDep_FV](#)

[GEANT4]: The total neutron energy deposited within the stops fiducial volume.
 - double [NeutronDep_ChrgWAvgTime_FV](#)

[GEANT4]: The charge-weighted average time of all neutron deposits within the stops fiducial volume.
 - double [NeutronDep_veto](#)

[GEANT4]: The total neutron energy deposited within the stops veto volume, but within the active LAr volume of the stop.
 - double [NeutronDep_ChrgWAvgTime_veto](#)

[GEANT4]: The charge-weighted average time of all neutron deposits within the stops veto volume, but within the active LAr volume of the stop.
 - double [PiCDep_FV](#)

[GEANT4]: The total charged pion energy deposited within the stops fiducial volume.
 - double [PiCDep_veto](#)

[GEANT4]: The total charged pion energy deposited within the stops veto volume, but within the active LAr volume of the stop.
 - double [Pi0Dep_FV](#)

[GEANT4]: The total neutral pion energy deposited within the stops fiducial volume.
 - double [Pi0Dep_veto](#)

[GEANT4]: The total neutral pion energy deposited within the stops veto volume, but within the active LAr volume of the stop.
 - double [OtherDep_FV](#)

[GEANT4]: The total 'other' particle energy deposited within the stops fiducial volume.
 - double [OtherDep_veto](#)

[GEANT4]: The total 'other' particle energy deposited within the stops veto volume, but within the active LAr volume of the stop.
 - double [TotalNonlep_Dep_FV](#)

[GEANT4]: The total non-GENIE-simulated-lepton particle energy deposited within the stops veto volume, but within the active LAr volume of the stop.
 - double [TotalNonlep_Dep_veto](#)

[GEANT4]: The total non-GENIE-simulated-lepton particle energy deposited within the stops veto volume, but within the active LAr volume of the stop.
 - bool [LepExit](#)

[GEANT4]: Whether the primary lepton left the active stop volume.
 - bool [LepExitBack](#)

[GEANT4]: Whether the primary lepton left the active stop via the +Z face.
 - bool [LepExitFront](#)

[GEANT4]: Whether the primary lepton left the active stop via the -Z face.
 - bool [LepExitYLow](#)

[GEANT4]: Whether the primary lepton left the active stop via the -Y face.
 - bool [LepExitYHigh](#)

[GEANT4]: Whether the primary lepton left the active stop via the +Y face.
 - bool [LepExitXLow](#)

[GEANT4]: Whether the primary lepton left the active stop via the -X face.
 - bool [LepExitXHigh](#)

[GEANT4]: Whether the primary lepton left the active stop via the +X face.
 - int [LepExitTopology](#)

- *[GEANT4]: The exit topology of the primary lepton.*
- double [LepExitingPos](#) [3]
 - *[GEANT4]: The exit 3-position of the primary lepton.*
- double [LepExitingMom](#) [3]
 - *[GEANT4]: The exit 3-momentum of the primary lepton.*
- bool [IsNumu](#)
 - *[EVENT SUMMARY]: Whether interaction involved a (anti-) muon neutrino*
- bool [IsAntinu](#)
 - *[EVENT SUMMARY]: Whether interaction an anti-neutrino*
- bool [IsCC](#)
 - *[EVENT SUMMARY]: Whether interaction was charged current*
- bool [Is0Pi](#)
 - *[EVENT SUMMARY]: Whether the GENIE simulation produced no final state pions.*
- bool [Is1PiC](#)
 - *[EVENT SUMMARY]: Whether the GENIE simulation produced one final state charged pion.*
- bool [Is1Pi0](#)
 - *[EVENT SUMMARY]: Whether the GENIE simulation produced one final state neutral pion.*
- bool [Is1Pi](#)
 - *[EVENT SUMMARY]: Whether the GENIE simulation produced one final state pion.*
- bool [IsNPi](#)
 - *[EVENT SUMMARY]: Whether the GENIE simulation produced multiple final state pions.*
- bool [IsOther](#)
 - *[EVENT SUMMARY]: Whether the GENIE simulation produced other final state particles.*
- int [Topology](#)
 - *[EVENT SUMMARY]: The summarised event topology*
- bool [HadrShowerContainedInFV](#)
 - *[EVENT SUMMARY]: Whether the hadronic shower is contained within the stop fiducial volume.*
- bool [PrimaryLeptonContainedInFV](#)
 - *[EVENT SUMMARY]: Whether the primary lepton deposits are contained within the stop fiducial volume.*

2.1.1 Detailed Description

Energy deposit and GENIE passthrough output tree.

2.1.2 Field Documentation

2.1.2.1 double EDep::EMassNeutron_True

[GENIE P/T]: The total mass energy of all neutrons at the end of the GENIE simulation.

N.B. It is most often the case that the mass energy of nucleons was not created during the neutrino interaction or subsequent cascade. A proxy reconstructed neutrino energy will often not use this energy.

2.1.2.2 double EDep::EMassProton_True

[GENIE P/T]: The total mass energy of all protons at the end of the GENIE simulation.

N.B. It is most often the case that the mass energy of nucleons was not created during the neutrino interaction or subsequent cascade. A proxy reconstructed neutrino energy will often not use this energy.

2.1.2.3 double EDep::EOther_True

[GENIE P/T]: The total energy of all other particles at the end of the GENIE simulation.

N.B. These do not include GENIE bindings or nuclear PDG codes. By eye, these are most often Kaons or Lambdas.

2.1.2.4 bool EDep::HadrShowerContainedInFV

[EVENT SUMMARY]: Whether the hadronic shower is contained within the stop fiducial volume.

N.B. This checks whether the total veto-region deposit is greater than the threshold passed by command line (or 10 MeV by default.). This can be fully recalculated given a different threshold by summing over the the XXXXDep_veto branches.

2.1.2.5 bool EDep::IsOther

[EVENT SUMMARY]: Whether the GENIE simulation produced other final state particles.

N.B. This is often due to gamma or kaon emission.

2.1.2.6 double EDep::LepDep_FV

[GEANT4]: The total lepton energy deposited within the stops fiducial volume.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation. i.e. This quantity will likely contain deposits from Michel electrons from stopped primary muon decays.

2.1.2.7 double EDep::LepDep_veto

[GEANT4]: The total lepton energy deposited within the stops veto volume, but within the active LAr volume of the stop.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation. i.e. This quantity will likely contain deposits from Michel electrons from stopped primary muon decays.

2.1.2.8 bool EDep::LepExit

[GEANT4]: Whether the primary lepton left the active stop volume.

N.B. This will track a primary electron, but that should shower very quickly. This branch is nominally designed for primary muons.

2.1.2.9 bool EDep::LepExitBack

[GEANT4]: Whether the primary lepton left the active stop via the +Z face.

N.B. This will track a primary electron, but that should shower very quickly. This branch is nominally designed for primary muons.

2.1.2.10 bool EDep::LepExitFront

[GEANT4]: Whether the primary lepton left the active stop via the -Z face.

N.B. This will track a primary electron, but that should shower very quickly. This branch is nominally designed for primary muons.

2.1.2.11 int EDep::LepExitTopology

[GEANT4]: The exit topology of the primary lepton.

- 0: Did not exit
- 1: Exit Back
- 2: Exit Front
- 3: Exit Y Low
- 4: Exit Y High
- 5: Exit X Low

- 6: Exit X High

N.B. This will track a primary electron, but that should shower very quickly. This branch is nominally designed for primary muons.

2.1.2.12 `bool EDep::LepExitXHigh`

[GEANT4]: Whether the primary lepton left the active stop via the +X face.

N.B. This will track a primary electron, but that should shower very quickly. This branch is nominally designed for primary muons.

2.1.2.13 `bool EDep::LepExitXLow`

[GEANT4]: Whether the primary lepton left the active stop via the -X face.

N.B. This will track a primary electron, but that should shower very quickly. This branch is nominally designed for primary muons.

2.1.2.14 `bool EDep::LepExitYHigh`

[GEANT4]: Whether the primary lepton left the active stop via the +Y face.

N.B. This will track a primary electron, but that should shower very quickly. This branch is nominally designed for primary muons.

2.1.2.15 `bool EDep::LepExitYLow`

[GEANT4]: Whether the primary lepton left the active stop via the -Y face.

N.B. This will track a primary electron, but that should shower very quickly. This branch is nominally designed for primary muons.

2.1.2.16 `double EDep::NeutronDep_ChrgWAvgTime_FV`

[GEANT4]: The charge-weighted average time of all neutron deposits within the stops fiducial volume.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.17 `double EDep::NeutronDep_ChrgWAvgTime_veto`

[GEANT4]: The charge-weighted average time of all neutron deposits within the stops veto volume, but within the active LAr volume of the stop.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.18 `double EDep::NeutronDep_FV`

[GEANT4]: The total neutron energy deposited within the stops fiducial volume.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.19 `double EDep::NeutronDep_veto`

[GEANT4]: The total neutron energy deposited within the stops veto volume, but within the active LAr volume of the stop.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.20 `int EDep::NOther`

[GENIE P/T]: The number of final state other particles in the event.

N.B. These do not include GENIE bindinos or nuclear PDG codes. By eye, these are most often Kaons or Lambdas.

2.1.2.21 double EDep::nu_4mom[4]

[GENIE P/T]: The 4-momentum of the incident neutrino in detector coordinates.

2.1.2.22 double EDep::OtherDep_FV

[GEANT4]: The total 'other' particle energy deposited within the stops fiducial volume.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.23 double EDep::OtherDep_veto

[GEANT4]: The total 'other' particle energy deposited within the stops veto volume, but within the active LAr volume of the stop.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.24 double EDep::Pi0Dep_FV

[GEANT4]: The total neutral pion energy deposited within the stops fiducial volume.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.25 double EDep::Pi0Dep_veto

[GEANT4]: The total neutral pion energy deposited within the stops veto volume, but within the active LAr volume of the stop.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.26 double EDep::PiCDep_FV

[GEANT4]: The total charged pion energy deposited within the stops fiducial volume.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.27 double EDep::PiCDep_veto

[GEANT4]: The total charged pion energy deposited within the stops veto volume, but within the active LAr volume of the stop.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.28 int EDep::PrimaryLepPDG

[GENIE P/T]: The PDG MC code of the primary lepton

i.e. the one that was born when the neutrino shed/absorbed an exchange boson

2.1.2.29 bool EDep::PrimaryLeptonContainedInFV

[EVENT SUMMARY]: Whether the primary lepton deposits are contained within the stop fiducial volume.

N.B. This is useful for checking whether electron neutrino events had contain EM showers, it is less useful for muon neutrino interactions.

N.B. This checks whether the total veto-region deposit is greater than the threshold passed by command line (or 10 MeV by default.). This can be fully recalculated given a different threshold by summing over the the LepDep_veto branch.

2.1.2.30 double EDep::ProtonDep_FV

[GEANT4]: The total proton energy deposited within the stops fiducial volume.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.31 double EDep::ProtonDep_veto

[GEANT4]: The total proton energy deposited within the stops veto volume, but within the active LAr volume of the stop.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.32 int EDep::stop

The detector stop number used, refer to input xml for stop offsets.

N.B. When overlapping stops are defined the event is randomly placed within one of the overlapping stops at the interaction position. The choice is weighted by the POTExposure branch in the input run plan xml.

2.1.2.33 int EDep::Topology

[EVENT SUMMARY]: The summarised event topology

Negative numbers indicate NC interactions.

- 1 : 0Pi
- 2 : 1PiC
- 3 : 1Pi0
- 4 : NPi
- 5 : other

2.1.2.34 double EDep::TotalNonlep_Dep_FV

[GEANT4]: The total non-GENIE-simulated-lepton particle energy deposited within the stops veto volume, but within the active LAr volume of the stop.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.35 double EDep::TotalNonlep_Dep_veto

[GEANT4]: The total non-GENIE-simulated-lepton particle energy deposited within the stops veto volume, but within the active LAr volume of the stop.

N.B. This branch rolls up all deposits by all descendent particles in the GEANT4 simulation.

2.1.2.36 double EDep::W_Rest

[GENIE P/T]: The reconstructed invariant mass

N.B. This assumes that the target nucleon was at rest and will not be the same W as thrown by the event generator during the cross-section calculation (single-pion production).

The documentation for this struct was generated from the following file:
